

# WhatBoutMe LMS: Development Plan

Sep 28, 2026 · @Kandel Nikhil Kamath

## Overview

We are building the complete platform for WhatBoutMe FZE (Roweena Britto, brain health coach), end to end: from the public website through to certification. The current site is [whatboutme.com](https://whatboutme.com), built on GoDaddy Website Builder. We replace it with our own Next.js website and a custom Learning Management System (LMS) on the same domain to run the **11 Steps to U** certification program online.

The platform must let a learner discover the program, pay, sign an agreement, join a batch, attend live sessions, work through 11 locked steps, pass quizzes and a final exam, and receive a certificate. Roweena and her team must run all of this from an admin panel without a developer.

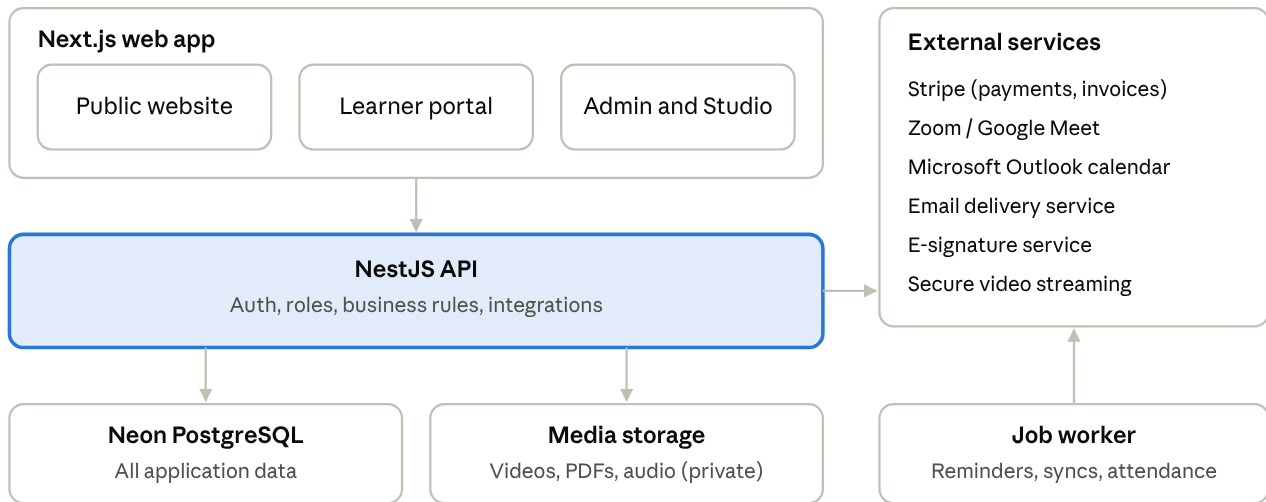

### Guiding principles

- One login per person, with what they see decided by their role.
- Program content is view-only. Nothing a learner watches or reads should be easy to download.
- Every live session, quiz and payment leaves a record, because certification depends on it.
- Admin should be able to change content, batches and questions without code changes.
- Build modular so new features can plug in later without rework.

## Tech stack and architecture

The stack is Next.js for the front end, NestJS for the back end API, and Neon (serverless PostgreSQL) as the database.

## One API serves the site, learner portal and admin panel

system architecture · web app, API, data, services

The browser never talks to the database or to Stripe, Zoom or Outlook directly. Everything goes through the NestJS API, which checks the user's role first.

### Front end (Next.js)

- One Next.js app with three areas: public website, learner portal, and admin panel (including Roweena's Studio).
- Public pages rendered on the server for SEO. Portal and admin pages behind login.
- Mobile-first layouts throughout. Most learners will use a phone.

### Back end (NestJS)

- Split into modules that match the feature list below: auth, users, programs, batches, content, quizzes, exams, sessions, attendance, payments, agreements, chat, notifications, certificates, reports.
- A separate job worker handles scheduled and slow work: reminders, calendar sync, pulling meeting attendance, sending emails, generating certificates.
- Real-time connection (websockets) for chat and live notifications.
- Webhook endpoints for Stripe, Zoom or Google Meet, and the e-signature service.

### Data and storage

- Neon PostgreSQL holds all application data. Use separate branches for development, staging and production.

- Videos go to a secure streaming service, not plain file storage. PDFs and audio go to private object storage and are served only through short-lived signed links.

## Environments

- Development, staging (the live preview link Roweena reviews) and production on whatboutme.com.

## User roles and permissions

Four roles, checked on the server for every request. A person has one role; Super Admin can change it.

| Role           | Who                                          | What they can do                                                                                                                                                                                                               |
|----------------|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Super Admin    | Foxwel.AI and Roweena                        | Everything. Creates courses, registrations, batches, pricing, coupons and invoices. Manages admins, platform settings, integrations (Stripe, Zoom, Outlook, email), certificate templates, agreement templates and audit logs. |
| Admin          | Roweena and senior staff                     | Manages programs, the 11 steps, content, quizzes, question bank, batches, pricing and coupons. Approves certificates, grades oral exams, sees all learners, payments and reports.                                              |
| Manager        | Team members who run batches                 | Manages learners and sessions in the batches assigned to them. Marks attendance, schedules sessions, replies to chats, sends announcements. Cannot change pricing, content or other managers' batches.                         |
| User (learner) | Enrolled students and corporate participants | Sees only their own dashboard, batch, unlocked steps, sessions, chat, invoices and certificates. Can share their progress.                                                                                                     |

## Rules to build in

- Permissions are stored as named actions (for example "approve certificate", "edit content") grouped into roles, so a role can be adjusted later without code changes.
- Managers only see data for batches they are assigned to.
- Every admin and manager action that changes a learner's status (unlock step, override quiz, approve certificate, refund) is written to an audit log with who, what and when.
- Admin login uses two-step verification (email or authenticator code).

## Core entities

These are the main things the system stores and how they relate. The developer designs the actual tables.

| Entity                 | What it holds                                                                                     | Linked to                     |
|------------------------|---------------------------------------------------------------------------------------------------|-------------------------------|
| User                   | Name, email, phone, country, time zone, role, status                                              | Enrolments, bookings, chats   |
| Program                | A course such as 11 Steps to U, Vision Board Workshop or Corporate Workshop, with price and rules | Steps, batches                |
| Step (module)          | One of the 11 steps: title, order, unlock rule, CPD hours                                         | Program, lessons, quiz        |
| Lesson / resource      | A video, PDF or audio item inside a step, or in the resource library                              | Step or library category      |
| Batch                  | A group of learners taking a program together: name, start date, manager, capacity, schedule      | Program, enrolments, sessions |
| Enrolment              | One learner in one batch: status, progress %, current step, CPD hours                             | User, batch                   |
| Quiz and question bank | Questions, options, correct answer, tagged by step                                                | Step, final exam              |
| Attempt                | One quiz or exam attempt: questions shown, answers, score, pass or fail                           | Enrolment                     |
| Session                | A live class or 1:1 call: type, time, meeting link, host, recording link                          | Batch or user                 |

| Entity                   | What it holds                                                                        | Linked to       |
|--------------------------|--------------------------------------------------------------------------------------|-----------------|
| Attendance               | Who joined a session, join and leave times, minutes present, source (auto or manual) | Session, user   |
| Payment and invoice      | Stripe payment, amount, currency, coupon, invoice number and PDF                     | User, enrolment |
| Agreement                | Contract template version, signed copy, signing date, IP and status                  | User, enrolment |
| Certificate              | Certificate number, template, issue date, approval status, share link                | Enrolment       |
| Conversation and message | 1:1 chat thread between a learner and staff, messages, attachments, read status      | Users           |
| Notification             | Email or in-app message, template, schedule, delivery status                         | User            |
| Audit log                | Who did what, when, on which record                                                  | All             |

## Feature plan by module

The learner journey runs in this order, and each module below serves one part of it:

1. Visitor lands on whatboutme.com and picks a program.
2. Signs up, pays through Stripe, gets an invoice.
3. Signs the program agreement online.
4. Is placed in a batch and gets a welcome email with the first session.
5. Attends live classes and works through the 11 steps, each unlocked by passing the previous step's quiz.
6. Takes the final written exam and the oral assessment.
7. Has the closing call, then receives a certificate after admin approval.

## Course management (Super Admin)

Everything a learner can buy is set up by Super Admin from the panel, with no developer involved. The platform must support many courses, not only 11 Steps to U.

## Courses

- Create, edit, duplicate, publish, unpublish and archive a course.
- Course details: name, short and long description, cover image, category (certification, workshop, corporate), delivery mode (online, in person, hybrid), duration, CPD hours, language.
- Course structure: add steps or modules, lessons, quizzes and final exam rules. A course can have steps with unlock rules (like 11 Steps) or be a simple open course (like a one-day workshop).
- Choose which features the course uses: quizzes, final exam, oral assessment, attendance requirement, agreement, certificate type.
- Assign a certificate template and an agreement template per course.
- Each published course automatically gets its own page on the website.

## Pricing and registration

- Set one or more prices per course (INR, AED, USD), early bird price with an end date, and optional instalment plans.
- Create coupons: percentage or fixed, per course or all courses, usage limit, expiry date.
- Open or close registration per course or per batch. Set a registration deadline and seat limit, with a waitlist when full.
- Custom registration form fields per course (for example company name for corporate, city for in-person workshops).
- See all registrations per course: paid, pending payment, agreement pending, enrolled, cancelled, refunded.
- Add a learner manually (offline payment or complimentary seat) and mark the payment method.
- Corporate registration: one company pays for several participants, each gets their own login.

## Batches per course

- Create batches under a course, each with its own start date, schedule, capacity, manager and price if different.
- Learners register for a specific batch, or are auto-placed into the next open batch.

## Invoices and payments

- Invoice settings: company details, logo, invoice number format and sequence, tax fields (VAT for UAE, GST for India if applicable), footer notes.

- Invoices generated automatically on payment, and manually for offline or corporate payments.
- View, download, resend and cancel invoices. Issue credit notes for refunds.
- Record refunds (full or partial) through Stripe from the panel.
- Payments list with filters by course, batch, date, status and currency, and export to Excel.
- Revenue summary by course, batch and month.

## 1. Public website

- Full rebuild of [whatboutme.com](https://whatboutme.com), moving off GoDaddy Website Builder while keeping the domain and existing page URLs where possible (set redirects for any that change).
- Pages carried over and redesigned: Home, About Me, 11 Steps to U Program (certification with 25 CPD Hours, UK), Vision Boards, Speaker (resilience speaker on brain health), Let's Talk (contact and booking), Terms and Conditions.
- Home keeps the current sections: the three offers (11 Steps to U, Speaker, Vision Board), Roweena's story, client testimonials, certifications and badges, social handles.
- Sign In and Create Account on the header connect to the new learner portal, replacing the GoDaddy account and bookings pages.
- Program pages pull name, price, dates and open batches from the admin panel, so no code change is needed to update them. The Get Started buttons lead straight into registration.
- Enquiry form on Let's Talk saves leads to the admin panel and emails the team.
- Footer keeps the coaching disclaimer (not a substitute for professional mental health or medical care) on every page.
- Social links to Instagram, LinkedIn and YouTube. Cookie consent banner.
- SEO basics: page titles, descriptions, sitemap, social sharing previews. Carry over existing titles and descriptions so search ranking is not lost.

## 2. Registration, payment and agreement

- Sign up with email and password or a one-time email code. Capture country and time zone at sign-up.
- Stripe Checkout for payment, with coupons, full or instalment options if Roweena wants them, and both INR and AED/USD pricing.

- Automatic invoice (numbered, with WhatBoutMe FZE details) emailed and stored in the learner's account.
- After payment, the learner signs the program agreement online. Access to Step 1 stays locked until it is signed.
- Agreement templates are versioned in admin. The signed PDF, date, time and IP are stored against the enrolment.
- Build the signing step in-app first (read, tick consent, type full name, draw signature). Keep the option to switch to a third-party e-sign service later.

### 3. Batch management

- Admin creates a batch per intake: name (for example "11 Steps, Oct 2026"), program, start date, capacity, assigned manager, session schedule.
- New paid learners are placed into the open batch automatically, or moved manually by admin.
- A batch has its own session calendar, announcements, attendance sheet and progress view.
- Move a learner between batches without losing progress. Close or archive a finished batch.
- Batch-wide actions: send announcement, send reminder, export attendance and progress.

### 4. The 11 Steps program (learning modules)

- Program is built as 11 steps. Each step holds lessons (video, PDF, audio, text) in a set order, plus a 10-question quiz at the end.
- Step unlock rule: the next step opens only when the previous step's lessons are complete and its quiz is passed. Admin can also set a date-based release per batch if needed.
- Lesson completion is tracked (video watched to a set percentage, PDF opened, audio played).
- Admin can manually unlock or re-lock a step for one learner, with a logged reason.
- Content is managed in Roweena's Studio: upload, reorder by drag and drop, preview as a learner, publish or keep as draft.

## 5. Resource library

- A separate library of extra material (worksheets, readings, guided audios), organised by category and tagged by step.
- Access can be set per program, per batch or per step.
- View only: no download buttons, files open inside the platform viewer. See the content protection section.

## 6. Quizzes, exams and assessment

- Question bank managed by admin, tagged by step. Multiple choice to start, with room for other types later.
- Step quizzes: 10 questions each, pass mark set by admin, retry limit and wait time between retries set by admin.
- Final written exam: 50 questions drawn and shuffled from the bank, so each retake gives a different paper. Time limit set by admin.
- Oral assessment: booked as a session, scored by admin against a simple rubric, with notes stored on the learner's record.
- Learners see their score and which step to revisit. Admin sees results per learner and per batch.

## 7. Live classes and sessions

- Admin or manager schedules a session for a batch or books a 1:1. The meeting link (Zoom or Google Meet) is created automatically and added to Roweena's Outlook calendar.
- Booking types from the proposal, each with a fixed length and automatic naming: 11 Steps Welcome Call, 11 Steps Closing Call, 1:1 with Ro, Vision Board Workshop (online or in person), Vision Board Online, Speaker Discovery Call.
- Learners book slots from Roweena's available times, shown in their own time zone. Reschedule and cancel rules set by admin.
- Session page shows join button (active shortly before start), agenda and materials.
- After the class, admin uploads the recording or it is pulled from Zoom automatically. Recordings play in the view-only player for that batch.

## 8. Attendance tracking

- For online sessions, attendance is pulled from the Zoom or Google Meet participant report after the meeting: join time, leave time, minutes present.
- Match participants to learners by email. Unmatched names go to a review list for the manager to link.
- A minimum attendance rule (for example 75% of session time) decides "present". Set by admin.
- For in-person workshops, a check-in link or QR code marks attendance.
- Manager can correct attendance manually, with a logged reason.
- Attendance feeds certificate eligibility and the learner's dashboard.

## 9. Learner dashboard and progress sharing

- One screen showing: current step, progress %, CPD hours earned, next session, pending quiz, invoices, agreement, certificates.
- Progress sharing: learner can generate a public link or image card showing milestones reached (for example "Completed Step 6 of 11"), and share it to LinkedIn, Instagram or WhatsApp.
- Learner chooses what the share shows. Nothing is public unless they create a share.
- Certificates get a public verification page by certificate number, and an "Add to LinkedIn profile" button.

## 10. Certificates

- Issued only when all steps, quizzes, the final exam, oral assessment, required attendance and the closing call are complete.
- Held in a pending list until admin approves. Admin uploads and manages certificate templates.
- Generated as a PDF with learner name, program, date, CPD hours and certificate number.
- Corporate workshop track gets a separate certificate of participation with no exam or CPD hours.

## 11. One-on-one chat

- Private chat between a learner and the team (Roweena, admins, or the batch manager).
- Text, emoji, file and image attachments. Read receipts and typing status.

- Staff see a shared inbox of all learner conversations, can assign a chat to a team member, and mark it resolved.
- New message alerts in-app and by email if unread after a set time.
- Full chat history kept on the learner's record.

## 12. Workshops and corporate track

- Vision Board Workshop registration, online or in person, with its own payment and check-in.
- One-day corporate workshop: company registers, participants get logins, attendance is tracked, certificate of participation is issued.

## 13. Admin panel and reports

- Dashboard: active learners, revenue, new enrolments, batches in progress, pending certificates, unread chats.
- Learner profile view: everything about one person in one place.
- Reports with export to Excel or CSV: payments, attendance by batch, quiz and exam results, progress by batch, certificates issued.

## Third-party integrations

All accounts are owned by WhatBoutMe and paid by the client at actual cost. Keys are stored as server secrets, never in the front end.

| Service                             | Used for                                                                        | Notes                                                                                  |
|-------------------------------------|---------------------------------------------------------------------------------|----------------------------------------------------------------------------------------|
| Stripe                              | Checkout, coupons, invoices, refunds                                            | Client already uses Stripe in Dubai. Use webhooks to confirm payment before enrolling. |
| Zoom or Google Meet                 | Creating meeting links, recordings, participant reports for attendance          | Build behind one "meeting provider" layer so either can be switched on.                |
| Microsoft Outlook (Microsoft Graph) | Adding sessions to Roweena's calendar, reading her busy times for booking slots | Two-way: a clash in Outlook blocks that slot on the site.                              |

| Service                | Used for                                             | Notes                                                                                                 |
|------------------------|------------------------------------------------------|-------------------------------------------------------------------------------------------------------|
| Email delivery service | All transactional and reminder emails                | Use a proper sending domain on whatboutme.com with SPF and DKIM set up.                               |
| Secure video streaming | Hosting lesson videos and recordings                 | Needs signed playback links and domain restriction. Candidates: Mux, Bunny Stream, Cloudflare Stream. |
| Object storage         | PDFs, audio, images, signed agreements, certificates | Private bucket, signed links only.                                                                    |
| E-signature (optional) | Legal-grade signing if in-app signing is not enough  | Not needed at launch. In-app signing is used.                                                         |

## Content protection

No web platform can fully stop a determined person from screen-recording, so the goal is to make downloading hard and sharing traceable. Set this expectation with the client.

### Videos

- Stream through the video service with short-lived signed links, never a direct file URL.
- Restrict playback to whatboutme.com so embed links do not work elsewhere.
- Custom player with no download option and no right-click menu.
- Moving watermark over the video with the learner's name or email, so any leak can be traced.
- Consider DRM from the video provider later if leaks become a real problem.

### PDFs and audio

- Shown in an in-app viewer (PDF rendered page by page), no download or print button.
- Files served through the API with short-lived signed links, only to logged-in learners with access to that step.
- Light watermark with the learner's name on PDF pages.

### Account sharing

- Limit active sessions per learner (for example two devices). Logging in on a third device signs out the oldest.

- Log unusual activity, such as many logins from different countries, for admin review.

## Notifications and reminders

All emails use editable templates in admin (subject, body, on or off). Every message is also shown in the in-app notification bell. Send times respect the learner's time zone.

| Trigger                                     | Who gets it         | When                                                             |
|---------------------------------------------|---------------------|------------------------------------------------------------------|
| Sign-up, email verification, password reset | Learner             | Immediately                                                      |
| Payment received, invoice                   | Learner, admin copy | Immediately                                                      |
| Payment failed or instalment due            | Learner             | On failure, and before due date                                  |
| Agreement pending signature                 | Learner             | After payment, then a follow-up if unsigned                      |
| Welcome to batch                            | Learner             | On batch assignment                                              |
| Session reminder with join link             | Attendees           | 24 hours and 1 hour before                                       |
| Booking confirmed, rescheduled, cancelled   | Learner and host    | Immediately                                                      |
| New step unlocked                           | Learner             | On unlock                                                        |
| Inactivity nudge                            | Learner             | After a set number of days with no progress                      |
| Quiz or exam result                         | Learner             | After submission                                                 |
| Missed session, recording available         | Learner             | After the session                                                |
| New chat message                            | Recipient           | If unread after a set time                                       |
| Certificate issued                          | Learner             | On admin approval                                                |
| Daily summary                               | Admin, managers     | Each morning: new enrolments, pending certificates, unread chats |

- Admin can send a manual announcement to one learner, a batch, or everyone.
- Learners can turn off non-essential emails. Payment, agreement and session emails always send.
- Keep a log of every email sent and its delivery status.

## Non-functional requirements

- **Security:** passwords hashed, login rate limits, role checks on the server for every request, HTTPS only, secrets in environment settings, input validation on every form.
- **Privacy:** learners are in the UAE and India, so store only what is needed, let a learner download or delete their data on request, and keep a privacy policy and terms page.
- **Performance:** pages usable on mid-range phones on mobile data. Lazy-load video, compress images.
- **Time zones:** store all times in UTC, show them in each user's own time zone.
- **Currency:** support INR and AED or USD pricing per program.
- **Backups:** daily database backups with point-in-time restore (Neon supports this). Test a restore before go-live.
- **Monitoring:** error tracking on front end and API, uptime checks, alerts to Foxwel.AI.
- **Accessibility:** readable font sizes, captions support on videos, keyboard-friendly forms.
- **Handover:** source code in a repository owned by the client or shared with them, setup guide, admin user guide, and a training session for Roweena's team.
